Fasteners - Technical Specification

VERSION 1.1 – JANUARY 2023

Contents

Foreword	4
Introduction.....	5
1. Normative references.....	6
2. Terms and definitions.....	8
3. Symbol	9
4. Naming convention and configuration of products	10
4.1. Configuration of assemblies and kits	18
5. Dimensions.....	19
5.1. Bolts	19
5.1.1. Internal hexalobular [ISO10642-T]	19
5.2. Studs	20
5.2.1. Partially-threaded studs with external hexagon [Stud(hex)]	23
5.2.2. Partially-threaded studs with internal hexagon [Stud(i-hex)]	24
5.3. Nuts	25
5.3.1. Nuts \geq [M72]	25
5.3.2. Nut(ISR).....	26
5.4. Washers	27
5.4.1. Washers \geq [M72].....	27
5.5. Thread tolerances	27
5.5.1. External thread tolerances.....	27
5.5.2. Internal thread tolerances.....	28
5.6. Transition between shank and thread.....	28
6. Materials.....	29
6.1. Bolts and studs	29
6.1.1. Tensile strength.....	29
6.1.2. Hardness properties	30
6.1.3. Minimum ultimate tensile load / proof load	30
6.1.4. Carburisation and decarburisation	30
6.1.5. Surface discontinuities.....	30
6.2. Nuts	31
6.2.1. Surface discontinuities.....	31
6.3. Washers	31
7. Coatings	32
7.1. Electroplating [BZP]	32
7.2. Non-electroplating applied zinc flake coating [fI _{Znnc} -XX]	32
7.3. Non-electroplating applied zinc flake coating [fI _{ZnLnc} -XX]	33
8. Supplementary requirements	34
8.1. Supplementary requirement [R1].....	34
8.2. Supplementary requirement [R2].....	34

8.3. Supplementary requirement [SG]	35
8.3.1. Surface discontinuities.....	35
8.4. Supplementary requirement [SN].....	35
8.4.1. Fatigue test of [SN] bolts/studs	35
8.4.2. Test setup	35
8.4.3. Location of nut.....	36
8.4.4. Finite life test.....	37
8.4.5. Staircase test	38
8.4.6. SN curve generation and statistical assessment	39
8.5. Supplementary requirement [MKL]	40
8.6. Supplementary requirement [PL]	40
8.6.1. Lubrication	40
8.7. Supplementary requirement [TL]	42
8.8. Supplementary requirement [QR]	42
9. Identification/marking	43
10. Certificate	45
11. Packaging requirements.....	46
11.1. EUR pallet and frame requirements.....	46
11.2. VCI requirements	46
11.3. Requirements for marking and material identification	47
11.4. Requirements for [fIZnnc-XX] and [fIZnLnc-XX] protection	47
12. Key qualification deliverables	48

Foreword

This industry standard has been produced by a technical working group representing all parties of the supply chain for fasteners used in wind turbines. Working group participants are:

August Friedberg GbmH

Cooper and Turner Ltd

Dokka Fasteners AS

Envision Energy

Erreka fastening solutions

F. REYHER Nchfg. GmbH & Co. KG

GE Wind Energy

ITH Fasteners

Nordex SE

Peiner Umformtechnik

Schraubenwerk Zerbst GbmH

Siemens Gamesa Renewable Energy

TSF – global fastening solutions

Vestas Wind Systems

All users must ensure that they have the latest edition of this publication.

Introduction

This technical specification defines the naming convention and how to interpret the used syntaxes. The specification provides the possibility to cover all DIN, EN and ISO standards related to fasteners, including bolts, studs, nuts and washers. The specification covers dimensions, materials, coatings, supplementary requirements, identification/markings, certificates, packaging requirements and key qualification deliverables. The specification also provides a list of topics that needs to be addressed during qualification of new suppliers / existing suppliers. Requirements towards friction-controlling topcoats applicable for zinc flake coatings, dry-to-touch lubricants for stainless steel products and pre-lubricated products with a wet lubricant are also addressed. It furthermore specifies specific requirements towards type of product, e.g., geometrical requirements. The Wind Turbine Manufacturer reserves the right to perform destructive and non-destructive inspection of the received products by using the inspection procedure described in ISO 3269-1 to verify that the purchased products meet the specified technical requirements.

The standard thread configuration for products according to this specification is the recommended 6g/6H listed in ISO 965-1 and specified in section 5.5. Products according to this specification are to be manufactured with coarse thread and follow the recommendations from ISO 261-1 unless otherwise specified.

The documentation hierarchy for the documents attached to a specific product is as follows:

1. Drawing: where Principal symbol [G] is [Add] (see Section 9).
2. Technical specification(s).
3. Standards (DIN/EN/ISO).

It shall be noted that not all products have a drawing attached. In this case, all requirements from this specification apply.

General requirements

- Section 9 defines identification/marking requirements for products delivered according to this specification.
- Section 10 defines which certificates are to be delivered along with products delivered according to this specification.
- Section 11 defines the packaging requirements for products delivered according to this specification.
- Section 12 defines additional requirements that shall be covered during the qualification from each Wind Turbine Manufacturer. These requirements shall at any time be present upon request from Wind Turbine Manufacturer unless otherwise agreed.

It must be noted that this document is not valid for HV-sets in accordance with EN 14399 or DAST – Richtlinie 021.
